DRATA

CONTINUOUS COMPLIANCE

Continuous Monitoring and Tests

Run continuous control tests across your environment to surface failures, show ownership context, and demonstrate how controls perform over time—not just at a point in time. With Drata, you receive visibility into the status of every test in your workspace so you can track readiness and take corrective action when needed.

DISCOVER THE DRATA DIFFERENCE

▶ Test Controls in Your Environment

Drata continuously tests connected systems to verify controls operate as intended. Each test maps to an in-scope control, showing real performance—not a one-time snapshot. As your environment changes, tests auto-run and log pass/fail results over time so teams can spot drift and emerging failures between audits.

▶ Extend Monitoring with Custom Tests

Broaden monitoring beyond native integrations by bringing in data from homegrown, on-prem, or unsupported platforms. External systems can submit structured evidence through custom connections so monitoring reflects the full environment. Teams define custom test logic and tests run on a recurring basis to surface outcomes.

▶ Assign and Maintain Clear Control Ownership

Tie monitoring results to control owners so accountability is clear when controls drift or fail. Ownership stays consistent across frameworks, giving teams a shared view of responsibility with visible control status, history, and linked tickets.

▶ Prove Performance During Audits and Reviews

Drata preserves a time-stamped history of results so teams can prove control performance over time—not just at evidence collection. Auditors can see when tests ran and what changed, and teams can feel more confident in program accuracy.

Monitor and Test Controls
Continuously for Audit Readiness

HOW CONTINUOUS MONITORING & TESTS WORKS

Map Tests to Controls
Connect tests to one or more controls to see control readiness impacts across linked frameworks.

Split Tests by Use Case
Use Production for live tests against connected business systems, and Codebase to catch issues earlier in development.

Review Metrics
See the percentage of tests that passed their last run, as well as total passed, failed, and error tests.

View Test Details
Get a complete view of an individual test, including its results, findings, history, and related controls.

See Findings
Understand which individual items caused a test to fail and download findings for further remediation.

Track Remediation
Add or edit internal notes, create and manage tasks, and track linked tickets to support collaboration.
